In situ hybridization may be complemented by determining total mRNA levels in a given tissue by Northern blots, RNase protection assays, and polymerase chain reaction on cDNAs, which may be evaluated by densitometric scanning of autoradiograms or photographs. Similarly, total neuropeptide levels in a given tissue may be better quantitated by radioimmunoassays and immunoprecipitation analyses.

The number of samples with positive PCR results was small (25 using agar containing 6 g/mL of vancomycin and 31 using agar containing 8 g/mL of vancomycin) but illuminated a critical issue regarding discrepancies between PCR results and the results of culture.
