Using an approximation by near-critical Galton-Watson processes, we prove that under some assumptions on the model parameters which exclude clonal interference, the relative fitness process derived from the microscopic model converges, after suitable rescaling, in the large population limit to a power law function. This is joint work with Adri n Gonz lez Casanova, Anton Wakolbinger, and

In about 1990 David Aldous conjectured that the spectral gap of the interchange process is the same as that of the random walk on the same graph, but so far this has been proved only in some special cases. We prove the conjecture using a recursive strategy. The approach is a natural extension of the method already used to prove the validity of the conjecture on trees. The novelty is an idea
